Acknowledgement

This project is made with all my dedication and hardwork. I would like to mention our project guide Ms. Razia Khan who have supported and helped us at every step, who managed our schedule systematically. Her valuable guidance helped me throughout this project making. Also, I would like mention every one who took their time to check my errors and try to solve my errors.

This project has taught me to manage my time and also how to try harder to get to the solution and made me think harder and push my capabilities to new level. I would like to thank the department to give us this project so that we could try to think more and acquire more information and knowledge on this project.

A)System Documentation

1.Synopsis:

The project is to build an application program to reduce the manual work for managing the Interview, Employer, Post Job, Call Letter. It tracks all the details about the Call Letter, Employer Registration, Search Job.

The “Online Job portal” has been developed to override the problems prevailing in the practising manual system. This website is supported to eliminate and in some cases reduce the hardships faced by this existing system. Moreover this system is designed for the particular need of the company to carry out operations in a smooth and effective manner.

2.Hardware Requirements:

64-bit processor,1.70GHz,4gb ram

3. Software Requirements:

Front end : Asp.net, MVC ,C#, CSS, Java script

Back end: Sql server

4. Description of present system:

The developed Job Portal management system is **web-based** which Requires Employee Registration & Profiles, Job Search, Employer Registration & Profiles, and Subscription Option for both Employee and Employer etc. Employer can add Own Profile and post jobs and Job Seeker can Search Jobs based on Geographical Area (Country, State, and City), Qualification, and Company wise or on the Basis of Experience and Expertise wise.

5.Limitations of Present System:

User can't change his password. o No any membership.

User not get personal notification who had subscribe our website.

6. Proposed System and its advantages:

- The proposed system is Web based Website.
- The name is “Online Job Portal”.
- In the proposed system **Admin** can Insert Update and Delete records, also can view all that things.
- In the proposed system we are not covering all the modules as in current system but here we are implements required modules
- It is Web based Website so it is easy to interact with all the functionality.
- Admin can Insert, Update and Retrieve all blogs, posts, newsletter.
- User must login if they want to post\ want job.

Speed is also fast compare to mobile application

9.UML DIAGRAMS

What is ER Diagram?

ER Diagram stands for Entity Relationship Diagram, also known as ERD is a diagram that displays the relationship of entity sets stored in a database. In other words, ER diagrams help to explain the logical structure of databases. ER diagrams are created based on three basic concepts: entities, attributes and relationships.

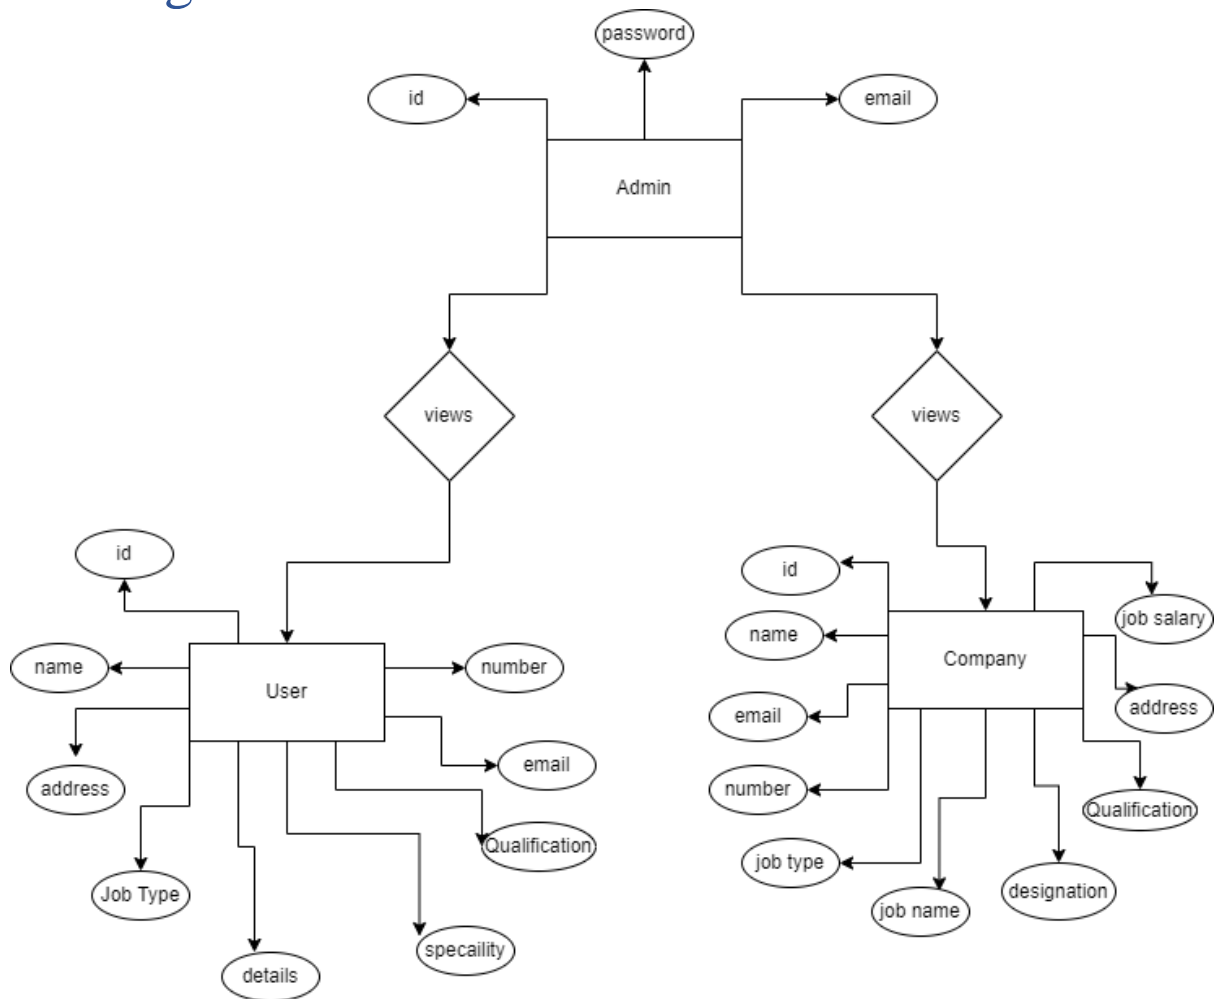

ER Diagrams contain different symbols that use rectangles to represent entities, ovals to define attributes and diamond shapes to represent relationships.

Following are the main components and its symbols in ER Diagrams:

- **Rectangles:** This Entity Relationship Diagram symbol represents entity types
- **Ellipses:** Symbol represent attributes
- **Diamonds:** This symbol represents relationship types
- **Lines:** It links attributes to entity types and entity types with other relationship types
- **Primary key:** attributes are underlined
- **Double Ellipses:** Represent multi-valued attributes

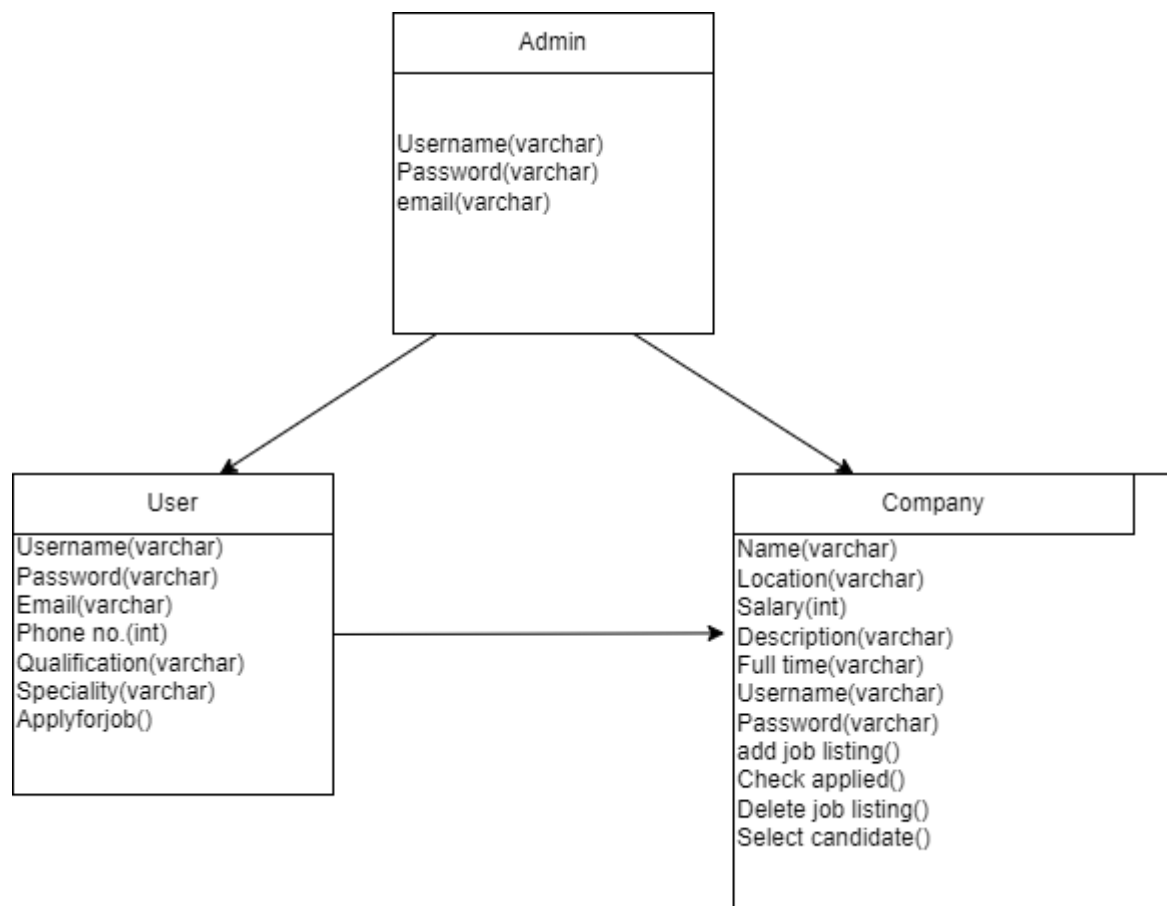

Er Diagram:

What is Class Diagram?

In software engineering, a class diagram in the **Unified Modeling Language (UML)** is **a type of static structure diagram** that describes the structure of a system by showing the system's classes, their attributes, operations (or methods), and the relationships among objects

Class Diagram:

What is a use case diagram?

In the Unified Modeling Language (UML), a use case diagram can summarize the details of your system's users (also known as actors) and their interactions with the system. To build one, you'll use a set of specialized symbols and connectors. An effective use case diagram can help your team discuss and represent:

- Scenarios in which your system or application interacts with people, organizations, or external systems
- Goals that your system or application helps those entities (known as actors) achieve

Use Case diagram:

What is sequence Diagram?

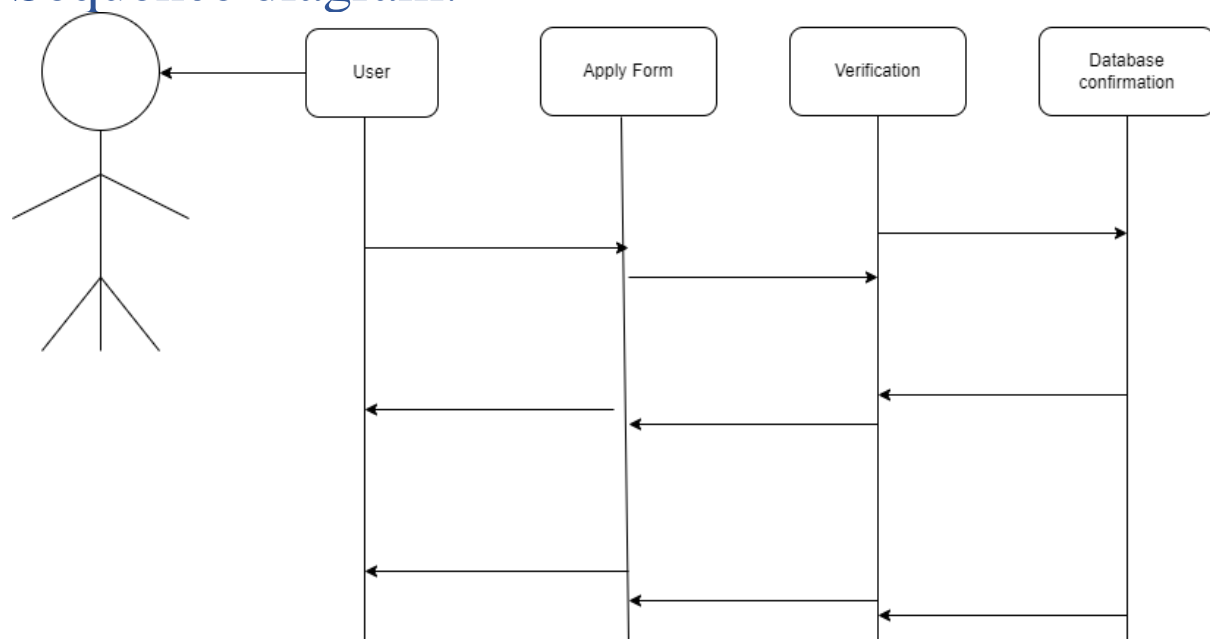

A sequence diagram is a type of interaction diagram because it describes how—and in what order—a group of objects works together. These diagrams are used by software developers and business professionals to understand requirements for a new system or to document an existing process. Sequence diagrams are sometimes known as event diagrams or event scenarios.

Benefits of sequence diagrams

Sequence diagrams can be useful references for businesses and other organizations. Try drawing a sequence diagram to:

- Represent the details of a UML use case.
- Model the logic of a sophisticated procedure, function, or operation.
- See how objects and components interact with each other to complete a process.

Sequence diagram:

The screenshot shows a web browser window with the URL `localhost:52294/Admin/ViewResume.aspx`. The page title is "Online Job Portal". The main content area is titled "View Resume/Download Resume". It contains a table with the following data:

Sr.No	Company Name	Job Title	User Name	User Email	Mobile No.	Resume	Delete
1	Test Company	App Developer	Rushi thokale	rushi@gmail.com	9850069599	Download	X

The sidebar on the left contains the following links: Dashboard, New Job, Job List, View Resume (active), User List, and Contact List. At the bottom of the sidebar is a "Logout" button. The Windows taskbar at the bottom shows the date as 29-09-2022 and the time as 12:12.

C) Validation

1. Test cases:

What is Test Case? "A Test Case has a component that describes an input, action or event expected response, to determine if a feature of an application is working correctly." Software testing can be stated as the process of validating and verifying that a computer

program/application/product: ☐ Meets the requirements that guided its design and development. ☐ Works as expected ☐ Can be implemented with the same characters. ☐ And satisfies the needs of Stakeholders.

Why we Write Test Case? A Test Case in Software Engineering is a set of conditions or variables under which a tester will determine whether an application, software system or one of its feature is working as it was originally established for it to do. The basic objective to write test case is to validate testing coverage for the application. Test Cases bring some sort of standardization and minimize the ad-hoc approach in testing.

2. Test Data:

List of variables and possible values used in the test case. You can list specific values or describe value ranges. The test case should be performed once for each combination Of values. These values written in set notation one per line. E.g.;

Username { Valid login, invalid login, login empty }

1) Username { Valid login, invalid login, login empty }

2) Password { Password cannot be blank }

3) UserType { usertype id is a compulsory attribute }

ONLINE JOB PORTAL

The screenshot displays a web browser window with the address bar showing 'localhost:52294/User/Login.aspx'. The page features a header with the 'Job Finder' logo and navigation links. A message at the top states 'Admin credentials are incorrect..!'. The 'Sign In' section contains three input fields: 'Username' (filled with 'Rushi'), 'Password' (filled with 'Enter Password'), and 'Login Type' (a dropdown menu with 'Admin' selected). A tooltip above the 'Login Type' dropdown reads 'Please fill out this field.'. Below the fields are a 'LOGIN' button and a link 'New User? Click Here..'. The browser's taskbar at the bottom shows the system clock as 11:58 on 06-10-2022.
